## 7. Description

Inventory No. 87A-45

#### Condition

	_excellent	deteriorated
X	_good	ruins
	fair	altered

Prepare both a one paragraph summary and a comprehensive description of the resource and its various elements as it exists today.

Sited at the end of a dirt road to the west of Croom Road, the Chase Tobacco Barn faces south across an open field with mature trees to the north.

The circa 1900 tobacco barn rests on a solid parged foundation and features a wood frame structural system clad in vertical boards. Hinged vertical air doors line the east and west elevations. The barn has a gable roof covered with corrugated metal sheets. A shed addition clad in vertical boards is attached to the west elevation. Both the shed addition and the main barn have double-leaf vertical board wood doors wide enough for tractors to enter.

The barn is currently in fair condition. The base of all the vertical boards has deteriorated. Access to the interior was not granted. Tobacco is no longer cultivated on the associated land.

2 Significance

Prepare a one-paragraph summary statement of significance addressing applicable criteria, followed by a narrative discussion of the history of the resource and its context. (For compliance projects, complete evaluation on a DOE Form – see manual.)

During the more than two centuries in which tobacco served as the money crop in Prince George's County, planters, indentured servants, slaves, and farmers developed utilitarian structures for tobacco curing and packing that have remained essentially the same to the present day. Early barns were square in plan and constructed of notched logs with open spaces between the logs to permit the circulation of air (a log dwelling had chinking and caulking between the logs to prevent the infiltration of air). Inside, scaffolding held the tobacco sticks with the leaves suspended from them in such a way as to allow air to flow over the drying tobacco to prevent mold. Farmers employing the fire-curing method lit small fires on the barn's earthen floor to lower the relative humidity (Percy 1979:33). The Prince George's County barns differed from those constructed in Virginia and North Carolina for the flue curing of bright-leaf tobacco, which employed a stove or firebox with a flue and require a different type of barn—one that was essentially airtight to hold the heat. By the 19<sup>th</sup> century, the increasing availability of sawn lumber enabled southern Maryland's farmers to construct timber-frame tobacco barns covered with wooden siding, usually vertical board siding. Southern Maryland's air cured tobacco utilized barns constructed with air doors along the sides that could be opened to facilitate the circulation of air. These air doors were three or four vertical boards fastened together and usually hinged that could be opened.

The earliest tobacco barns identified in the survey along Croom Road are the ca. 1820 Duvall Tobacco Barn (87A-31) and the 1800-1830 Watson Tobacco Barn (87A-55) and the most recent barns date to the middle of the twentieth century such as the Stielper (87A-48), Jackson (87A-47), and Chase (87A-44) tobacco barns. Although the dates of construction for the surveyed barns range over one hundred and thirty years, the construction materials, methods of construction, and form of the tobacco barn changed very little. All of the barns surveyed are wood-frame and clad in vertical boards; all of the barns contain four-foot by four-foot rooms to hang the tobacco; and all of the barns have hinged vertical board air doors to control the circulation of air within the barns. The changes in form are very minor but provide the most insight into the date of construction. Early nineteenth century barns have steeply pitched gable roofs. From about 1830 until 1900 the barns have more standardized gable roofs, sometimes with one side of the gable extended to create a shed roof over a stripping room. Around 1900, the use of tractors increased in Prince George's County and central double-leaf doors opening onto a wide central passage began to appear in the barn. The final form change was the advent of the gambrel roof, which created more space within the barn to hang tobacco. Gambrel roofs begin to appear in the 1930s and 1940s.

This tobacco barn is significant as an example of an early 20<sup>th</sup> century tobacco barn in Prince George's County and fits into the third period of tobacco barn construction. The double-leaf doors, large enough for farm machinery to enter and the gable roof indicate the c.1900 construction date.
